Field of the Invention

The present invention relates to antagonists and pharmaceutical compositions comprising said antagonists of the corticotropin releasing factor receptor ("CRF receptor") useful for the treatment of depression, anxiety, affective disorders, feeding disorders, post-traumatic stress disorder, headache, drug addiction, inflammatory disorders, drug or alcohol withdrawal symptoms and other conditions the treatment of which can be effected by the antagonism of the CRF-1 receptor.

Background of the Invention

20

It has been shown that the neuropeptide, corticotropin releasing factor ("CRF"), acting through its binding to the CRF-1 receptor, is a primary mediator of stress- and anxiety-related physiological responses in humans and other mammals by stimulating ACTH secretion from the anterior pituitary gland. *See* A.J. Dunn, et al., *Brain Res. Rev.*, 15: 71-100 (1990). Antagonists of the CRF-1 receptor, both peptides (J. Gulyas, et al., *Proc. Natl. Acad. Sci. U.S.A.*, 92: 10575-10579 (1995) and small molecules (J.R. McCarthy, et al., *Curr. Pharm. Design*, 5: 289-315 (1999)), have demonstrated the ability to ameliorate the effects of stressful stimuli in several animal models. In addition, marked elevations of CRF in cerebrospinal fluid have been detected in a large portion of individuals diagnosed with major depression and anxiety disorders, and the levels correlate with severity of the disease. *See* F. Holsboer, *J. Psychiatric Res.*, 33: 181-214 (1999). Following antidepressant treatment, the increased CRF levels observed

25

30

in depressed patients were reduced. *See* C.M. Banki, et al., *Eur. Neuropsychopharmacol.*, 2: 107-113 (1992); *see also* Effects of the high-affinity corticotropin-releasing hormone receptor 1 antagonist R121919 in major depression: the first 20 patients treated. Zobel AW, Nickel T, Kunzel HE, Ackl N, Sonntag A, Ising M, Holsboer F *J Psychiatr Res* 2000, 34, 171-181. CRF has also been shown to be a key mediator of several immune system functions through its effect on glucocorticoid plasma levels. *See* E.L. Webster, et al., *Ann. N.Y. Acad. Sci.*, 840: 21-32 (1998). Recent reviews of the activity of CRF-1 antagonists include P.J. Gilligan, et al., *J. Med. Chem.*, 43: 1641-1660 (2000) and J.R. McCarthy, et al., *Ann. Rep. Med. Chem.*, 34: 11-20 (1999). There appears a need to discover novel small molecule CRF antagonists in order to treat a wide variety of human disorders including depression, anxiety, bipolar disorder, and other stress-related illnesses. *See* WO 98/35967, WO 99/01454, WO 99/10350, WO 99/67247, WO 00/01675, WO 00/01697, WO 00/39127, WO 00/59907, WO 00/59908, EP 778277, EP 812831.

- 5    **General.**  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra in  $\text{CDCl}_3$  were run on a Bruker 500 or 300 MHz instrument and chemical shifts were reported in ppm ( $\delta$ ) with reference to  $(\text{CH}_3)_4\text{Si}$ . All evaporations were carried out under reduced pressure. Unless otherwise stated, LC/MS analyses were carried out on a Shimadzu instrument using a YMC C18 column (3 x 50 mm) employing a 2 min linear gradient of 0% to 100% solvent B in A in a 3 min run. For LC/MS and for Shimadzu Preparative HPLC system, Solvent A was: 10% methanol/90% water/0.1% trifluoroacetic acid, and solvent B was 90% methanol/10% water/0.1% trifluoroacetic acid with a UV detector set at 220 nm.

- 20    To a solution of 2,4,6-trimethylaniline (100. g, 0.740 mol) in anhydrous toluene (600 mL) was added 2-bromoethylamine hydrobromide (75.8 g, 0.370 mol). The flask containing the reaction mixture was fitted with a Dean-Stark trap/reflux condenser assembly. The reaction mixture was heated at reflux temperature for 5 h, during which time the mixture solidified. Upon cooling to room temperature,

A solution of Red-Al (3.3 M in toluene, 0.70 mL, 2.33 mmol) was added dropwise to a solution of 2-ethyl-7-(2,4,6-trimethyl-phenyl)-6,7-dihydro-5H-imidazo[1,2- $\alpha$ ]imidazole-3-carboxylic acid cyclopropylmethyl-propyl-amide (0.177 g, 0.46 mmol) in toluene (3 mL) at 0°C. To a  $0^\circ\text{C}$  solution of 2-ethyl-7-(2,4,6-trimethyl-phenyl)-6,7-dihydro-5H-imidazo[1,2-a]imidazole-3-carboxylic acid ethyl ester (1 mL of a 0.14M solution

in toluene) in tetrahydrofuran (1 mL) was added n-propylmagnesium chloride (0.84 mL of 1.0M in tetrahydrofuran). The resulting solution was removed from the ice bath and allowed to stir for 15 min. It was then heated at reflux for 14h. Upon cooling to room temperature, the reaction solution was quenched with saturated aqueous ammonium chloride, and the phases were separated. The aqueous phase was extracted twice with ether, and the combined organic portions were washed with brine, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub>, and concentrated under reduced pressure to give a yellow semi-solid (0.0448 g, 86%). LC/MS:  $t_R$  = 1.58 min., (MH<sup>+</sup>) = 370.31.

Upon cooling to room temperature, the solvent was evaporated under reduced pressure, and the residue was partitioned between ether and saturated aqueous sodium bicarbonate. - 5 To the N1-alkylated 2-bromo-4-ethyl imidazole derivative (2.83 g, 6.7 mmol) in sulfolane (67 mL) was added 1.1 equivalents of silver triflate. The resulting solution was stirred in the dark at 150°C under argon. Within 10 min the solution turned dark and it was stirred for 24 h when LC-MS indicated complete conversion to cyclized product. To a solution of the appropriate alcohol (0.092 mg, 0.25 mmol) in benzene (20 mL) was added thionyl chloride (0.15 g, 1.28 mmol) at 0°C, under argon. The reaction mixture was stirred for an hour the solvent was removed on a rotary evaporator. Traces of thionyl chloride were removed by co-evaporating with dichloromethane 3 times. The residue was dissolved in dichloromethane (50 mL) and to that solution was added the N-propyl-cyclopropylmethylamine (0.058 g, 0.512 mmol) and diisopropylethyl amine (0.099 g, 0.768 mmol) at rt. The reaction mixture was stirred overnight. Solvent was concentrated, the residue dissolved in methanol (2 mL) and purification carried out by reverse phase preparative HPLC using water, methanol, trifluoroacetic acid to obtain the

**General Procedure for the Synthesis of Examples 150-282:**

10 (For **Examples 150-252** LC/MS were run using the following conditions:  
 Column, YMC S5 4.6×50 mm; run time, 4 mins.)

An amine hydrochloride salt or a free amine (0.65 mmol, 5 equiv.) was added to  
 an oven-dried 11 mL vial. After the addition of anhydrous acetonitrile (1 mL)  
 15 and anhydrous *i*-Pr<sub>2</sub>NEt (0.16 mL, 0.91 mmol, 7 equiv in the case of an amine-  
 HCl salt, or 43  $\mu\text{L}$ , 0.26 mmol, 2 equiv in the case of a free amine), the mixture  
 was stirred at room temperature for 1 h, followed by the addition of a solution of  
 a chloromethyl compound (0.13 mmol) in MeCN (1 mL). The resulting mixture  
 was stirred at room temperature for 24 h, or heated at 80 °C for 16 h if a  
 20 trifluoromethyl-containing amine hydrochloride salt was employed. After  
 removing solvents and excess of *i*-Pr<sub>2</sub>NEt in vacuo, the residue was dissolved in  
 dimethylformamide or acetonitrile (2 mL) and CF<sub>3</sub>CO<sub>2</sub>H (30  $\mu\text{L}$ ) was added. The  
 mixture (in most cases, a clear solution) was filtered into a Prep-HPLC vial, and  
 title compounds were obtained by Prep-HPLC.

- 15 many of the above examples:

**Intermediate 118****2-Cyclopropylethylamine hydrochloride**

A 1M solution of borane in tetrahydrofuran (250 mL, 2 equiv.) that had been cooled to 0°C was added to cyclopropylacetonitrile (10.00 g, 123.3 mmol) at 0°C under nitrogen. The stirred mixture was heated at reflux for 12 hours, cooled to 0°C, and then carefully quenched with methanol (50 mL). The mixture was heated at reflux for 2 hours and then, upon re-cooling to 0°C, treated with a solution of t-butylpyrocarbonate (37.67 g, 1.4 equiv.) in methylene chloride (25 mL). The resulting mixture was stirred at room temperature overnight and then evaporated. The residue was partitioned between ethyl acetate and water. The organic was washed with water, brine, dried over magnesium sulfate, and evaporated to give the crude Boc-protected amine. This was dissolved in methylene chloride (25 mL) and treated with 4M hydrogen chloride in dioxane (77 mL, 2.5 equiv.). The mixture was stirred at room temperature overnight and then evaporated. The resulting white solid was triturated with ether and the product was collected by filtration, washed with ether, and dried *in vacuo* (12.72 g, 85%). <sup>1</sup>H-NMR δ (CDCl<sub>3</sub>) 0.14 (m, 2H), 0.52 (m, 2H), 0.75 (m, 1H), 1.66 (q, 2H), 3.09 (m, 2H), 8.27 (br, 3H).

**Intermediate 119****3,3,3-Trifluoroacetic acid N-hydroxysuccinimide active ester, scheme 8: (MM)**

A stirred solution of 3,3,3-trifluoroacetic acid (9.7 mL, 110 mmol) and N-hydroxysuccinimide (13.92 g, 1.1 equiv.) in methylene chloride (100 mL) at 0°C

was treated with EDC hydrochloride (21.08 g, 1 equiv.). The mixture was allowed to warm to room temperature. After stirring overnight, the solvent was evaporated and the residue partitioned between ethyl acetate and water. The organic phase was washed with brine, dried over magnesium sulfate, and  
5 evaporated to give the crude active ester which was used without further purification (22.78 g, 92%).  $^1\text{H-NMR}$   $\delta$  ( $\text{CDCl}_3$ ) 2.86 (s, 4H), 3.51 (q, 2H).

A stirred solution of 3,3,3-trifluoroacetic acid N-hydroxysuccinimide active ester (12.98 g, 57.65 mmol) in methylene chloride (80 mL) at  $0^\circ\text{C}$  was treated with cyclopropylmethylamine (5.0 mL, 1 equiv.). The mixture was stirred at room temperature for 14 hours and then evaporated. The residue was partitioned  
15 between ethyl acetate and water. The organic phase was washed with water, brine, dried over magnesium sulfate, and evaporated to give the crude amide. This was dried under high vacuum for several hours and then, under a nitrogen atmosphere at  $0^\circ\text{C}$ , it was carefully treated with a 1M solution of borane in tetrahydrofuran (173 mL, 3 equiv.). The mixture was heated at reflux for 14  
20 hours and then re-cooled to  $0^\circ\text{C}$ . Methanol (50 mL) was added very carefully to avoid excess foaming, and the mixture was heated at reflux for 5 hours. Upon re-cooling to  $0^\circ\text{C}$ , a solution of t-butylpyrocarbonate (17.62 g, 1.4 equiv.) in methylene chloride (25 mL) was added. The resulting mixture was stirred at room temperature overnight and then evaporated. the residue was partitioned

This was dissolved in methylene chloride (25 mL) and treated with 4M hydrogen chloride in dioxane (36 mL, 2.5 equiv.). The mixture was stirred at

#### 10 CRF<sub>1</sub> Receptor Binding Protocol

CRF<sub>1</sub> receptor antagonists, by occupying the same receptors, blocks the accessibility of the receptors to CRF, a hypothalamic factor mediating body's responses to physiological and psychological stress. The following radioligand binding assay examines the ability of the antagonists to bind the CRF<sub>1</sub> receptors by assessing their ability to compete with binding of CRF to the receptors in cell membrane. Compounds of the present invention exemplified in examples 1-15 all showed K<sub>i</sub> values less than 75 micromolar. See Table I.

*Tissue culture and membrane preparation.* IMR-32 cells were grown at 37°C in 5% CO<sub>2</sub> as a monolayer in medium consisting of MEM supplemented with 10% heat-inactivated fetal bovine serum, 0.1 mM nonessential amino acids, 1 mM sodium pyruvate and 2 mM L-glutamine. Cells were transformed by exposure to 2.5 µM 5'-bromo-2'-deoxyuridine for 10 days. After transformation, cells were rinsed twice with phosphate-buffered saline, and incubated for 10-15 min. at 4°C

in homogenization buffer consisting of 50 mM Tris (pH 7.2), 10 mM MgCl<sub>2</sub> and 2 mM EGTA. Cells were transferred from plates to polypropylene tubes (16 x 100 mm), homogenized and centrifuged at 32,000 x g for 15 min. Pellets were resuspended by homogenization in buffer and centrifuged at 32,000 x g for 15 min. Pellets were resuspended in homogenization buffer then stored at -80°C until needed.

*Radioligand binding assays.* Membranes (150 µg /well) were incubated with [<sup>125</sup>I]-oCRF (100 pM) and increasing concentrations of test compound for 100 minutes at 25°C in a total volume of 200 µl. The assay buffer consisted of 50 mM Tris (pH 7.2), 10 mM MgCl<sub>2</sub>, 0.5% BSA, 0.005% Triton X-100, 10 µg/mL aprotinin and 10 µg/mL leupeptin. Assays were stopped by addition of ice-cold wash buffer (50 mM Tris, pH 7.4 and 0.2% BSA). Filtration over glass fiber filters (Whatman GF/B) previously soaked in 50 mM Tris, pH 7.2 and 1% BSA was carried out using a Brandel cell harvester. Filters were washed with 10 mL of ice-cold wash buffer. Non-specific binding was defined with 10 µM oCRF. IC<sub>50</sub> values for oCRF and test compounds were calculated by nonlinear regression using a one-site binding curve (GraphPad Prism).
